

Trading Dashboard: Color Coding & Tab Visualization

Standardizing Position Colors & Arbitrage/GER Comparison Tabs

■ Global Color Coding Standard

ESTABLISH ONCE AND FOR ALL:

■ RED	Short Position (Pozycja Krótka)
■ GREEN	Long Position (Pozycja Długa)

This color scheme applies consistently across ALL charts, tabs, and visualizations.

Requirement 1: Arbitrage Tab (Forecast/Plotting)

Purpose: Show arbitrage opportunities between F1 and F2 contracts

Current Logic:

Position: Long F1, Short F2

Formula: $Arbitrage = F1 - F2$

When Arbitrage > 0 (F1 is more expensive)

Action: Take SHORT position on F1, LONG position on F2

Benefit: Profit from the spread

Bar Color: ■ RED (Short position on F1 is profitable)

Bar Direction: Positive values going UP

When Arbitrage < 0 (F2 is more expensive)

Action: Take LONG position on F1, SHORT position on F2

Benefit: Profit from the reverse spread

Bar Color: ■ GREEN (Long position on F1 is better)

Bar Direction: Negative values going DOWN

Chart Requirements:

- ✓ X-axis: Time periods / Dates
- ✓ Y-axis: Arbitrage spread value
- ✓ All bars must be RED or GREEN (NO GRAY)

✓ Bars clearly indicate direction and magnitude

Example:

Day 1: $F1 - F2 = +2.5 \rightarrow$ ■ RED bar (short F1 is good)

Day 2: $F1 - F2 = -1.8 \rightarrow$ ■ GREEN bar (long F1 is good)

Day 3: $F1 - F2 = +0.3 \rightarrow$ ■ RED bar (slight short opportunity)

Requirement 2: Ger Comparison Tab

Purpose: Compare generation (Ger) values with the same color coding standard

Current Issue: GRAY BARS DETECTED

Some bars are displayed in GRAY — this is **NOT ACCEPTABLE**

Desired Behavior:

Every bar must be classified as:

- GREEN if it represents a LONG position benefit
- RED if it represents a SHORT position benefit

Gray Bars - Root Cause Analysis:

1. Identify why bars are gray (undefined value? neutral? missing data?)
2. Implement logic to classify ALL values as RED or GREEN
3. If value = 0 or neutral, choose a default behavior

Chart Requirements:

- ✓ All bars must be RED or GREEN
- ✓ No gray, no neutral, no undefined colors
- ✓ Same color logic as Arbitrage tab
- ✓ Positive values $\rightarrow$ RED or GREEN based on context
- ✓ Negative values $\rightarrow$ GREEN or RED (opposite)

Requirement 3: Tab Naming Update

Current:	Forecast/Plotting or Forecast Plotting
New:	Forecast Plotting (delivery date)

Apply to:

- Main tab label in navigation
- Page header/title
- Breadcrumb or section labels

Purpose: Clarify that forecast and plotting data is specific to a delivery date context.

■ Color Specifications

RED (Short Position)

Hex: #E74C3C or #D32F2F

RGB: (227, 76, 60) or (211, 47, 47)

Usage: Bars where short position is profitable/favorable

GREEN (Long Position)

Hex: #27AE60 or #388E3C

RGB: (39, 174, 96) or (56, 142, 60)

Usage: Bars where long position is profitable/favorable

NO GRAY - Remove any neutral/undefined colors:

- #808080 (Avoid)
- #999999 (Avoid)
- #CCCCCC (Avoid)

■ Implementation Checklist

- ✓ Apply global color standard: RED = short, GREEN = long
- ✓ Update Arbitrage tab: Positive values = RED, Negative values = GREEN
- ✓ Validate Arbitrage formula: $F1 - F2$ is correctly calculated
- ✓ Remove ALL gray bars from Ger Comparison tab
- ✓ Classify all values in Ger Comparison as RED or GREEN
- ✓ Verify no null/undefined values in data sources
- ✓ Update tab name to "Forecast Plotting (delivery date)"
- ✓ Ensure consistent color logic across both tabs

- ✓ Test with multiple date ranges and scenarios
- ✓ Verify visual clarity: RED and GREEN easily distinguishable

■ Questions for Clarification

1. What does a positive vs. negative Ger value mean? (surplus/deficit? buy/sell signal?)
2. If Arbitrage = 0 or Ger value = 0, what color should it be?
3. Is Ger Comparison from database or real-time feed? Any potential null values?
4. Should each tab have a legend explaining the color scheme?
