

SPOT Section: Two New Pages

SPOT Daily & SPOTS History — Build Specification

Build two pages in the **SPOT** section: **SPOT Daily** and **SPOTS History**. Both work with hourly price/volume data for two fixings (FIX1/F1 and FIX2/F2).

Page 1: SPOT Daily

Purpose

On-demand hourly price report for a single fixing (FIX1 or FIX2), for a chosen delivery date. One fixing is shown at a time, selected via combo box.

Data Fetching

- Two buttons: **"Update FIX1"** and **"Update FIX2"**.
- On click, the system uses the **existing pipeline** to download prices for the selected fixing.
- If prices for that day **already exist in the database**, show a clear on-page message (don't silently refetch).
- If source data is **15-minute** granularity, take the **average of the four quarter-hours** for the hourly price, and aggregate volume to compute hourly volume.

Controls

- **Fixing combo:** F1 / F2 — default **F1**.
- **Date picker:** any date (history supported) — default = **today**.
- **Default on load:** today's date, FIX1.

Report Body — Hourly Table

Date	Hour	Price [PLN/MWh]	Volume [MW]
15.06.2026	H01	491.85	2 688
15.06.2026	H02	459.01	2 866
...	...	...	...
15.06.2026	H24	445.00	3 311

- 24 rows (H01–H24); header reflects selected fixing.
- Show **total volume** sum below the table (e.g. 83 658).
- **Quarter-hour transformation:** toggle to expand hourly view into 15-min data when available.

Aggregated Metrics (below the hourly table)

Product	Hours	Value
BASE	H01–H24	599.50
PEAK	H08–H22	623.86
OFFPEAK	H23–H07	558.88
LowOFF	H01–H07	525.89
LowPEAK	H08–H17	531.66

HighPEAK	H18–H22	808.28
HighOFF	H23–H24	674.36

Plus price stats: **min**, **max**, and **max – min** (spread).

Excel Export

- Button to download report to Excel (.xlsx).
- **Export exactly what is visible:** hourly view → hourly rows; quarter-hour view → quarter-hour rows. Include the aggregated metrics block.
- Output must be clean and self-contained (user forwards it onward).

Page 2: SPOTS History

Purpose

Historical analysis of hourly data for a chosen fixing. Compares a selected **product** (Peak/Offpeak/etc.) against **BASE**, across time periods, year-over-year.

Controls (Parameters)

- **Fixing:** F1 / F2 — default **F1**.
- **Period:** Month / Quarter / Year — default **Month**.
- **Product:** Peak / OffPeak / LowPeak / HighPeak / LowOff / HighOff — default **Peak**.

Output — Three Tables

All three share the same row structure (one row per period — months 1–12 when Period = Month) and columns grouped by year.

Table 1 — BASE average: arithmetic mean of BASE per period/year. BASE only (independent of product).

Table 2 — Product average: arithmetic mean of the selected product per period/year.

Table 3 — Ratio: Selected Product / BASE (Table 2 ÷ Table 1), cell by cell.

BASE (T1)					PRODUCT (T2)				RATIO (T3)		
month	2024				2024	2025	2026		2024	2025	2026
1	a	a1	a2		b	b1	b2		a/b	a1/b1	a2/b2
2	...				...				...		
...											
12											

Period = Quarter → rows Q1–Q4; Period = Year → one row per year.

Product Definitions (canonical — show at bottom of both pages)

Product	Hours
BASE	H01–H24
PEAK	H08–H22
OFFPEAK	H23–H07 (wraps overnight)
LowOFF	H01–H07
LowPEAK	H08–H17
HighPEAK	H18–H22
HighOFF	H23–H24

Implementation Notes

- Reuse the existing data pipeline for fetching; don't build a new fetch path.
- Cache check before refetch (the "already in DB" message).
- Consistent numeric formatting (PLN/MWh to 2 decimals; volume integer w/ thousands separators).

- Both pages live under the existing SPOT section nav.
- 15-min → hourly: average prices, aggregate volume; preserve quarter-hour drill-down on SPOT Daily.

Open Items to Confirm

- **Volume from 15-min:** prices averaged across four quarters — should volume be **summed** or **averaged**? (Doc is ambiguous; sum is usual for volume.)
- **Total volume** (83 658) — confirm this is the sum of all 24 hourly volumes.
